(57) Abstract :

A method and system for protecting conversation are explored in this invention, with the help of machine learning and Internet of Things (IoT)-connected devices. The invention underpins this methodological approach. The Internet is a worldwide system of interconnected computer networks that exchange data and information using predefined rules and regulations. The Internet, or the World Wide Web, is a global network of local area networks (LANs) and personal computers (PCs). The idea behind the IoT is that with the help of a smartphone and a wireless sensor network, any inanimate object, not just computers and computer networks, can be read, recognised, localised, addressed, and controlled remotely. Put another way, the idea of the Internet of Things (IoT) originates here (IoT). The success of the Internet of Things hinges on this idea (IoT). This idea has the potential to make the Internet of Things a reality.
